# **Chapter 1: Introduction to the South African Consumer Price Index (CPI)**

## **1. Defining the Consumer Price Index**

The CPI is a current social and economic indicator constructed to measure changes over time in the general level of prices of consumer goods and services that households acquire, use, or pay for. The index aims to measure the change in consumer prices over time. This is done by measuring the cost of purchasing a fixed basket of consumer goods and services of constant quality and similar characteristics. The products in the basket are selected as being representative of households' expenditure during a year or other specified period. Such an index is called a fixed-basket price index. The index also aims to measure the effects of price changes on the cost of achieving a constant standard of living (i.e. level of utility or welfare). This concept is called a cost-of-living index (COLI).

## **2. The South African CPI**

### **2.1 Uses of the South African CPI**

The South African CPI has three equally important objectives:

1. To measure inflation in the economy so that macroeconomic policy is based on comprehensive and up-to-date price information.
2. To provide a deflator of consumer expenditure in the expenditure national accounts and other economic data.
3. To measure changes in the cost of living of South African households to promote equity in the measures taken to adjust wages, grants, service agreements and contracts.

### **2.2 History of the South African CPI**

The South African CPI originated in 1917, covering large urban areas only. Since 1997 smaller urban areas were included. Prior to January 2006, all prices of goods and services were collected from the head office of Statistics South Africa (Stats SA) mainly using the post and fax. A direct collection methodology, that entailed collecting prices of goods directly by visiting retail outlets, was piloted in July 2004. This direct collection methodology was rolled out region by region. Since 2006, the CPI has been compiled using the prices of goods from the direct collection methodology in all areas.

## **3. Alignment with international best practice in CPI formulation**

### **3.1 Adoption and use of methodology in line with international best practice**

Stats SA has committed itself to the adoption and use of methodology that is in line with international best practice and which is relevant and practicable to South African conditions. The sources and methods documents of other statistical agencies are also used as reference material.

### 3.2 International expert groups

The International Labour Organization (ILO) is the authoritative body on the methodology for price statistics and the compilation of CPIs. The ILO is supported by other organisations including the United Nations Statistics Division (UNSD), International Monetary Fund (IMF) and the World Bank. The ILO manual for CPIs is the main reference for statistical offices for CPI concepts and definitions. The manual provides the theory and conceptual framework of the CPI and aims to give methodological and practical guidelines for the compilation of CPIs. Stats SA largely follows the methodology guidelines in the ILO manual when compiling the South African CPI. <http://www.ilo.org/public/english/bureau/stat/guides/cpi/index.htm#manual>

The introduction of new and improved methodology comes as a result of technical and academic discussions of current methodology through a number of expert groups. New methodology may be captured through resolutions taken at official meetings of these groups in consultation with the ILO. The groups provide a forum for specialists to share their experiences and discuss research and methodology on crucial problems of measuring price change, and thereby identify best practice. These groups include:

- The Ottawa Group, which was formed in 1994. This group is also known as the United Nations International Working Group on Price Indices. The group focuses on applied research in the area of consumer price indices. The group has played a key role in the theoretical and methodological development of price indices.
- ILO/UNECE joint meeting. The joint meeting is organised by the United Nations Economic Commission for Europe (UNECE) and the ILO. Compilation issues are discussed including collection, processing and dissemination of data, and resource and organisational issues.

### 3.3 International participation

#### 3.3.1 International comparisons programme

The International Comparisons Programme (ICP) is a global statistical initiative established in 1970 to produce internationally comparable price and expenditure data as well as purchasing power parity (PPP) estimates to facilitate cross-country comparisons of price levels, Gross Domestic Product (GDP) and related economic aggregates in real terms and free of price and exchange rate distortions. The ICP uses Purchasing Power Parities (PPPs) to effect conversion. PPPs are spatial price indices. They make it possible to compare the GDPs and component expenditures of countries in real terms by removing the price level differences between them. The programme is globally managed by the World Bank and implemented by regions, namely, Africa, Asia and Pacific Islands, South America, the Commonwealth of Independent States (CIS) and Russia, Western Asia and Europe. Stats SA participates in the ICP through collection of prices of goods and services as prescribed by the ICP basket, of which some are already being collected. <http://www.worldbank.org/en/programs/icp>

### **3.3.2. Harmonised Consumer Price Index (HCPI)**

The Harmonised Consumer Price Index (HCPI) is defined as the Consumer Price Index (CPI) developed from comparable methodologies. That means CPIs which have been developed from concepts, definitions and methods that are comparable. The Member States HCPIs are produced by respective Member States using agreed harmonised methodologies. The SADC HCPI is compiled by the SADC Secretariat by aggregating the National HCPIs of the Member States. HCPI is meant to provide an official measure of inflation in the SADC region, and it makes international comparisons easier since the national HCPIs are produced using harmonised methodologies and as much is practicable using the same statistical classifications, standards and frameworks. The SADC Secretariat has been implementing the Harmonised Consumer Price Index (HCPI) since August 2011. <http://www.sadc.int/news-events/newsletters/harmonised-consumer-price-index-newsletter/>

## Chapter 2: Classification of goods and services

### 1. Background

The South African CPI uses the Classification of Individual Consumption by Purpose (COICOP) for goods and services. COICOP is the international standard for classifying household expenditure. Goods and services are classified according to their intended use. It is an integral part of the 1993 System of National Accounts (SNA). COICOP is used for household budget surveys, consumer price indices and international comparisons of Gross Domestic Product (GDP) and its component expenditures.

### 2. Classification of Individual Consumption by Purpose (COICOP)

The United Nations Statistical Division (UNSD) is the custodian of COICOP. The high level COICOP categories are given below:

- 01 - Food and non-alcoholic beverages
- 02 - Alcoholic beverages and tobacco
- 03 - Clothing and footwear
- 04 - Housing, water, electricity, gas and other fuels
- 05 - Furnishings, household equipment and routine household maintenance
- 06 - Health
- 07 - Transport
- 08 - Communication
- 09 - Recreation and culture
- 10 - Education
- 11 - Restaurants and hotels
- 12 - Miscellaneous goods and services
- 13 - Individual consumption expenditure of non-profit institutions serving households (NPISHs)
- 14 - Individual consumption expenditure of general government

#### 2.1 Individual consumption

Individual consumption expenditures are those that are made for the benefit of individual persons or households. More specifically:

- All consumption expenditures by households are defined as individual. These are contained in COICOP categories 01 to 12.

- Only some of the consumption expenditures of general government are defined as individual. Expenditures on general public services, defence, public order and safety, economic affairs, environmental protection and housing and community amenities are considered to be for the benefit of the community as a whole rather than for individual households. They are termed “collective consumption expenditures” (or “actual final consumption of general government” or “actual collective consumption”) and are excluded from COICOP.

The Consumer Price Index focuses on households and thus uses COICOP categories 01 to 12. Illegal products such as prostitution and narcotics are excluded from the South African CPI.

## 2.2 Structure of COICOP classification in the South African CPI

The structure of COICOP is made up of 2-digit, 3-digit, 4-digit, 5-digit, 8-digit and 12-digit classification levels. The 12-digit is the most detailed whilst the 2-digit is the least. The table below shows an example of a decomposition of a 2-digit level down to 8-digit level.

**Table 1: Example of COICOP hierarchy**

COICOP	Product code	COICOP description	Indicator product
<b>01.</b>	<b>Food and non-alcoholic beverages</b>		
<b>01.1.</b>	<b>Food</b>		
<b>01.1.1</b>	<b>Bread and Cereals</b>		
01.1.1.1	01111001	Rice	Rice
01.1.1.2	01112001	Bread	Loaf of white bread
01.1.1.2	01112002	Bread	Loaf of brown bread
01.1.1.2	01112003	Bread	Sweet biscuits
01.1.1.2	01112004	Bread	Savoury biscuits
01.1.1.3	01113001	Pasta products	Spaghetti
01.1.1.3	01113002	Pasta products	Macaroni
01.1.1.3	01113003	Pasta products (excluding spaghetti and macaroni)	Pasta (excl. spaghetti, macaroni)
01.1.1.4	01114001	Pastry-cook products	Cake and tarts
01.1.1.6	01116001	Cake flour	Cake flour
01.1.1.6	01116002	Bread flour	Bread flour
01.1.1.6	01116005	Cold cereal	Cold cereal

The numbering system for the different classification levels has been simplified by naming the different levels using names such as categories, classes, and groups. The table below shows the naming convention for the different classification levels.

**Table 2: COICOP naming convention**

COICOP level	Name	Example
2-digit	Category	Food and non-alcoholic beverages
3-digit	Class	Food
4-digit	Group	Bread and cereals
5-digit	Product	Bread
8-digit	Indicator product	Loaf of white bread
12-digit	Sampled product	Albany 700 g loaf of white bread in XXX store in YYY area.

### 2.3 Product types

The COICOP four-digit levels (Groups) are divided into different types of products:

- Services (S);
- Non-durables (ND);
- Semi-durables (SD); and
- Durables (D).

The following extract from the ILO Manual gives the standard definitions of the types of products as used in price statistics:

The distinction between non-durable goods and durable goods is based on whether the goods can be used only once or whether they can be used repeatedly or continuously over a period of considerably more than one year. Moreover, durables, such as motor cars, refrigerators, washing machines and televisions, have a relatively high purchasers' value. Semi-durable goods differ from durable goods in that their expected lifetime of use, though more than one year, is often significantly shorter and their purchasers' value is substantially less.

The categories of goods defined as durables in COICOP are listed below:

- furniture and furnishings;
- major household appliances whether or not electrical;
- major tools and equipment;
- vehicles;
- telephone and fax equipment;
- information processing equipment;
- musical instruments;
- equipment for the reception, recording and reproduction of sound and pictures; and

- jewellery, clocks and watches.

The following goods are listed as semi-durables:

- clothing and footwear;
- household textiles;
- small electrical household appliances;
- glassware, tableware and household utensils;
- small tools and miscellaneous accessories;
- spare parts for vehicles;
- recording media;
- games, toys, hobbies;
- equipment for sport, camping, etc.;
- books; and
- other personal effects.

The following goods are listed as non-durables:

- food and non-alcoholic beverages;
- alcoholic beverages and tobacco;
- materials for the maintenance and repair of the dwelling;
- electricity;
- non-durable household goods;
- pharmaceutical products;
- fuels and lubricants;
- gardens, plants and flowers;
- pets and related products;
- newspaper and periodicals;
- stationery and drawing materials; and
- personal care products.

The following are listed as services:

- actual rentals paid by tenants;
- imputed rentals for owner-occupiers;
- services for the repair and maintenance of a dwelling (plumbers and electricians);
- water supply and other services relating to the dwelling n.e.c.;
- domestic services and household services;
- medical services;
- dental services;

- hospital services;
- maintenance and repair of personal transport equipment;
- other services in respect of personal transport equipment;
- transport services;
- postal services;
- telephone and telefax services;
- recreational and sporting services;
- cultural services;
- games of chance;
- package holiday;
- education;
- restaurants and hotels;
- accommodation services;
- social protection services;
- insurance;
- financial services n.e.c.; and
- other services n.e.c.

Some COICOP classes contain both goods and services because it is difficult, for practical reasons, to break them down into goods and services. Such classes are usually designated as a service when the service component is considered predominant; for example services for the maintenance and repair of the dwelling, which includes the cost of labour and materials.

#### **2.4 Mixed purpose goods and services**

There are some products whose intended use changes according to geographical location; hence COICOP may be tweaked to suit local conditions. Goods and services with multi-purpose use are allocated to a category that represents the dominant use, e.g. food consumed outside the home is shown under Restaurants and hotels and not in Food and non-alcoholic beverages. Some services may consist of a bundle of goods and services that serve mixed purposes. A purpose breakdown of each bundle is done in order to produce the most precise fit that is consistent with practical considerations of data availability. An example of mixed-use products is the purchase of in-patient hospital fees, which include payments for medical treatment, accommodation and catering.

## **Chapter 3: Weights in the CPI**

### **1. Introduction**

The weights of the CPI represent the proportions of consumption expenditure by households in a specific period. Each indicator product in the CPI has a weight attached to it which reflects its relative importance in the overall index. The impact that a price change for a good or service has on the overall index is therefore determined by the weight attached to it. The weighted sum of changes in the price of specific products and services in the CPI provides the rate of inflation. Whereas the prices are updated on a monthly, quarterly or annual basis, the weights are normally updated only every four or five years.

There are two types of weighting for the construction of an aggregated price index for a population on the basis of Household Expenditure Survey (HES) results. These are called plutocratic and democratic. Plutocratic weights reflect total expenditures of all reference households and the composition of the estimated aggregate values of the reference population. In this type of weighting, each household contributes to the weights an amount proportional to its expenditure. This is the method used to calculate the CPI weights.

Democratic weighting gives equal importance to all households by averaging consumption value proportions over the whole population instead of summing consumption values. Democratic weights reflect the expenditure of an average household.

In terms of geographical coverage, all expenditure made by residents outside the boundaries of the country is excluded. However, all expenditure by non-residents within the country are included; this is referred to as the domestic concept. If all expenditure made by residents outside the boundaries of the country is included, then the national concept would be applied. Stats SA has adopted the domestic concept for the scope of the CPI. This includes all expenditure by private households/consumers within the boundaries of South Africa, irrespective of the place of normal residence of the consumer.

### **2. Need to update weights**

The reference period is the time period to which the estimated weights relate. The chosen period should cover a seasonal cycle, typically a calendar year, and should reflect economic conditions that are reasonably normal or stable. Any irregularities may need to be adjusted.

The accuracy of weights to represent current expenditure patterns decreases as the length of time increases from the weight reference period. However, the frequency of updating weights depends on the availability of the expenditure survey results.

The choice of a weights reference year should ideally avoid periods of high inflation or periods when the influence of special factors is significant.

The ILO manual lists the following sources for weights:

- Household expenditure surveys (HES). The main requirements of HES are that the survey should be representative of all private households in the country, should not exclude any particular group, and should include all types of consumption expenditures by households. HES include expenditures that are outside the scope of the CPI, but these should be excluded from the total expenditure used to estimate CPI weights. Examples are interest payments on credit cards or mortgage bonds.
- National accounts. The household sector in national accounts consists of all individual households and institutional households. Institutional households are usually excluded from HES. National accounts expenditure estimates may be used to adjust the weights of products that are known to suffer from significant cases of under- or over-reporting.
- Retail sales data. Retail sales statistics can provide detailed data at area and product level. The main difficulty in using the data is that it usually contains data for groups that are outside the CPI reference population, e.g. expenditure by businesses.
- Scanner data. Cash register data may be used to derive CPI weights.
- Population censuses. Population statistics may be used in the absence of any expenditure statistics as a basis for regional weights.

For most countries, the HES is the main source for deriving CPI weights. The HES usually requires the use of supplementary data sources to supplement in order to deal with known cases of under- or over-reporting. The use of a combination of HES data and national accounts is a common way of deriving CPI weights.

### **3. Deriving CPI weights**

#### **3.1 Household Expenditure Survey (HES)**

In the previous years, Stats SA has run two versions of a Household Expenditure Survey, the Income and Expenditure Survey (IES) and Living Conditions Survey (LCS). The primary objective of both the IES and LCS is to provide information on households' consumption expenditure patterns. However, the LCS also provides estimates for monitoring poverty levels. Successive HES gauge changes in household consumption patterns, levels of income and income distribution.

##### **3.1.1 Living Conditions Survey (LCS) 2014/15<sup>1</sup>**

---

<sup>1</sup> Refer to [www.statssa.gov.za](http://www.statssa.gov.za) for further information on the LCS.

In 2014/15 Stats SA conducted its latest HES, namely the Living Conditions Survey. The Living Conditions Survey is a household-based survey which uses a countrywide sample of dwelling units to measure a snapshot of the levels of income and expenditure for households during a specified reference period. The sample consisted of 30 818 dwelling units covering the whole country. The LCS 2014/15 used a combination of the recall and diary methods.

The LCS 2014/15 ran from 13 October 2014 to 25 October 2015. This allowed for a 12-month period in which seasonal expenditure patterns were captured. The sample was evenly spread over 12 survey periods of one month. The sample was kept nationally representative in each quarter.

Fieldworkers administered a main questionnaire that was divided into four separate interview modules, each covering different topics. This was done over four separate visits with one interview module covered per visit. The main questionnaire covered all household acquisitions of durable and semi-durable goods and services over the 11 months prior to the survey. The information collected also includes the income of each household member in the survey month and during the 11 months prior to the survey.

As in the IES 2010/11, the LCS 2014/15 used a 2-week period for diary completion. The year was thus divided into 26 periods to ensure continuous recording of expenditure by representative households. This was an attempt to minimise under-reporting of certain expenditures due to respondent 'fatigue'.

The general approach used to collect information on household consumption expenditure during this survey was that of acquisition. The acquisition approach takes into account the total value of all goods and services acquired, whether consumed or not, during a given period, whether or not paid for (wholly or partly) during the period of collection. Expenditure on certain household expenditure categories were covered only in the diaries. Expenditure items that were collected by the diary are:

- Food and non-alcoholic beverages;
- Personal care;
- Alcoholic beverages and tobacco; and
- Restaurants.

### **3.2 LCS 2014/15 weights and adjustments for CPI weights**

In accordance with general international practice, Stats SA uses the survey of household expenditure to provide the basis of the CPI weights. However, well-established practice is that additional sources are used in cases where the HES may under- or overreport certain expenditures. All calculations are done for the total country expenditure. Specific CPI index weights (e.g. headline CPI) are calculated following the macro adjustments. In order to account for significant price movements between the

survey period and the implementation of the weights, Stats SA has employed a technique known as price-updating which applies a relevant inflation rate to each index.

The difference in expenditure proportions between the LCS and the new CPI weights is shown in Table 4. Although the weights are reported as a percentage, they are calculated on the rand value of total expenditure. All adjustments to the LCS were made based on actual expenditure, not the final proportions.

**Table 4: Difference in expenditure proportions between LCS and CPI weights (Total country)**

COICOP category	LCS shares	CPI 2016 weights
Food and non-alcoholic beverages	12,9	19,15
Alcoholic beverages and tobacco	0,9	5,88
Clothing and footwear	4,8	4,04
Housing and utilities	32,6	22,55
Household contents, equipment, and maintenance	5,2	4,33
Health	0,9	1,26
Transport	16,3	14,72
Communication	3,4	2,62
Recreation and entertainment	3,8	4,86
Education	2,5	2,34
Restaurants and hotels	2,1	3,41
Miscellaneous	14,7	14,84

Additional data sources for compiling weights include the private household consumption expenditure accounts of the GDP, sectoral surveys conducted by Stats SA of the retail, motor trade and food and beverages industries, excise tax receipts, industry associations' data summaries, and summarised transaction data from retailers.

Adjustments were made to the LCS results in respect of frequently purchased items and under-reporting for food and non-alcoholic beverages, and personal care (under Miscellaneous), restaurants and hotels, and alcoholic beverages and tobacco, health, transport, education. Significant methodological changes in weights calculation were applied to the following categories: Owner-occupied housing, Motor vehicles, Games of chance, and Insurance. The "net expenditure approach" was applied to Second-hand motor vehicles, Games of chance, and Insurance. The net expenditure approach adjusts for any returns to household either as income or claims made. This is done to avoid any double counting. Below are details on adjustments made on the expenditure groups.

### 3.2.1 Food and non-alcoholic beverages

This category is subject to under-reporting because many food items are purchased throughout the month and by different household members. The total value for food and NAB is based on Stats SA's

2013 Retail Trade Large Sample Survey (LSS). These values were escalated using the monthly retail trade survey results. In addition, a national accounts estimate for food sales through informal and small businesses was added. More detailed groups utilised a combination of the LCS and LSS values and retailer sales data.

### **3.2.2 Alcoholic beverages and tobacco**

Values for this category were derived from excise tax data, using national accounts calculations to subtract any sales of alcoholic beverages to businesses. The spending on alcoholic beverages and tobacco is in line with industry estimates and the values reflected in the national accounts.

### **3.2.3 Housing and utilities**

The rental equivalence approach to owner-occupied housing was introduced to the CPI in 2009. At that time the weight was based on a rental yield which was applied to the market value of the property as estimated by the owner occupier. This method is still used in the calculation for LCS results.

The CPI weights were calculated using an alternative method. Housing data in the LCS were split between (actual) rented and owner occupied. The dwellings were matched according to location and physical characteristics. The rental value for similar dwellings was then used to derive a rental equivalence for owner-occupied dwellings.

### **3.2.4 Health**

Regulatory data was used to adjust the LCS out-of-pocket medical expenses for over-the-counter, prescription medication and consultations.

### **3.2.5 Transport**

Three adjustments were made to value in the transport category. First, new vehicles sales were adjusted upwards from the LCS based on national accounts estimates and industry sales data. Secondly, the value of fuel purchases and the split between petrol and diesel was adjusted using national accounts and industry estimates.

The third adjustment was to calculate net expenditure on used vehicles (purchases less income from sale of used vehicles) using national accounts estimates. Sales between households are regarded as having a net expenditure of zero. Accordingly, only the margin imposed by the car dealer and purchases of vehicles from the corporate sector should be considered as expenditure for this product.

### **3.2.6 Recreation and entertainment**

Games of chance were adjusted as respondents tend to under-report their spending on gambling. Data were sourced from the Gambling Board and the National Lotteries Commission to obtain the value of bets made by punters, less payout received.

Spending on subscription for pay TV services was adjusted using supplier data.

### **3.2.7 Education**

Stats SA's financial survey of higher educational institutions was used to derive an estimate on university tuition fees. A split between FET and university enrolment numbers obtained from the Council for Higher Education and the Department of Higher Education was used in order to derive estimated spending at FET colleagues.

### **3.2.8 Restaurants and hotels**

The values for restaurants and hotels have been adjusted, both for underreporting. Different household members often incur expenditure in restaurants individually and they may not report all of this in the household diary. Expenditure on alcohol away from home may also be under-reported for the reasons discussed under alcohol and tobacco above.

This category was adjusted using national accounts supply and use tables by calculating a ratio for alcoholic beverages consumed at home versus alcoholic beverages consumed at restaurants, bars, taverns, etc. The overall estimate for alcoholic beverages was multiplied with the calculated ratio in order to derive an estimate of alcoholic beverages consumed away from home.

### **3.2.9 Personal care**

Similar to food, consumers tend to under-report their expenditure on personal care items. Data from Stats SA's large sample and monthly retail sales were used to obtain a more accurate estimate for personal care.

### **3.2.10 Insurance**

The CPI insurance class includes short-term (dwelling, household contents, motor vehicle, funeral) insurance and medical aid/health insurance. The values from the LCS have been adjusted to account for reporting errors, as well as to account for the premium net of claims approach.

When comparing LCS results with the statutory reports of oversight structures, it was evident that medical aid premiums have been under-reported in the expenditure survey. This is most likely because the premium may be paid directly by an employer on behalf of the policy holder, in part or in full. Data from the Council for Medical Schemes (CMS) was used to arrive at a more realistic level for medical aid premium payments.

Data from the CMS and the Financial Services Board (which regulates the short-term insurance industry) was used to determine the amount of money that was paid out in claims directly to members. It is assumed that this money would be captured as expenditure elsewhere by the LCS and it is therefore subtracted from the total premiums in order to avoid double counting. Claims paid directly to third-party service providers were not considered in this calculation.

All other values used in the CPI weights were taken directly from the Income and Expenditure Survey results. Comparative tests were conducted to ensure that they were in line with other surveys.

## **Chapter 4: CPI Basket of goods and services**

### **1. Introduction**

The basket is a list of specific goods and services which forms the sample for price collection in the CPI.

### **2. Basket of goods and services for South African CPI**

In January 2017, Stats SA published an information note on the process and outcome of selecting a new basket. Each province has its own basket. Every product that appears in at least one provincial basket is included in the national basket.

### **3. Selection criteria for the basket of goods and services**

Determining the basket composition at a disaggregated provincial level improves the relevance of the CPI to the purchasing patterns at a local level. The baskets reflect the pattern of residence rather than the point at which purchases are made. For publication purposes, Stats SA compiles indices at provincial level.

The basket selection is conducted per 'index' area. The objective of the process is to ensure inclusion in the basket of those goods and services that represent the greatest share of expenditure within a group. Products are included in the basket if they contribute at least 0,1% of the total household expenditure. Within product classification, products are ranked from highest to lowest and cumulative 80% of expenditure is selected.

The 2016 CPI contains 412 products, which is slightly more than the 2012 basket, which had 393 products. The provincial baskets and list of goods and services are provided in Appendix 1 and can also be found on Stats SA's website.

## Chapter 5: Sampling and CPI operations

### 1. Introduction

This chapter explains the sampling and collection methodology for all indicator products. There are two principal data collection groupings. These are the field and head office collections.

### 2. Sampling methodology

The most common procedure used for price collection is a sample survey. There are various methods of sampling, whether determined by probability or not. It is important that Statistics South Africa (Stats SA) follows an internationally accepted practice when sampling occurs within the CPI. This section discusses the sampling method used by Stats SA.

South Africa has the following restrictions in terms of sampling:

- No sampling frame is available.
- Price collection must take place where there are price collectors.
- A probability sample with respect to the base period is not a proper probability sample with respect to the current period.
- Sales values or units at sub-urban area level are virtually impossible to obtain.

Any sampling method applied needs to maximize precision and minimise the cost of carrying out the survey. Given the restrictions mentioned above, outlet selection is purposive and sampled products are selected as follows:

- The item selected should be the most popular item in terms of brand and unit. The volume seller is assumed the most popular item. In general, the volume seller is assumed to be the brand and unit with the most shelf space allocated to it.
- The outlet should expect to continue selling the product.
- The item should be regular merchandise. An item is considered to be regular merchandise if the outlet normally sells the item. Special order items that are one-time, one-of-a-kind purchases are not eligible for the index.
- The item must be in good condition.

### **3. Field and head office collection**

Field-based collection entails the use of fieldworkers (price collectors) who visit sampled outlets and markets in order to record actual prices on the shop floor. The field collection is mostly used for commodities. The collection is carried out on a monthly basis.

The head office collection entails the use of staff based at Stats SA's head office mostly for the collection of prices for services. These collections are carried out by e-mail, internet and telephonic surveys. The history and nature of the frequency of changes in prices for specific types of products informs the decision on whether prices should be collected monthly, quarterly or annually.

### **4. Auditing**

Stats SA quality assurance audits are conducted on all data collection. The purpose of quality assurance audits is to ensure that the CPI methodology is correctly applied by the fieldworkers at the outlets and by head office collectors. The audit process allows the auditors to confirm if prices and products collected by the price collectors are correct. Audits are performed parallel to price collection. For the purpose of general coverage and to ascertain the general level of quality, all nine provinces are audited during a year.

### **5. Data editing**

Edits are performed to detect if there are any errors in the data and, if so, to verify and correct those errors. The main objective of editing is to ensure clean data is prepared for analysis. There are four stages in CPI editing:

- Validation stage: check if the correct codes were allocated during capturing and allocate missing unit codes.
- Phase 1: Logical edits, ensure that the current and previous months' data do not have contradictory values.
- Phase 2: Range edits, identify whether the data item value falls inside a determined acceptable range.
- Phase 3: check the correctness of all the allocated unit status codes.

### **6. Product maintenance**

The aim of product maintenance is to ensure there are enough prices for each product in each provincial basket. This process involves substitution of items that are temporarily unavailable, out of season items, and permanently unavailable items. Products and outlets that are permanently closed or temporarily closed for two consecutive months are substituted.

## **7. Listing of indicator products and methods**

Appendix 2 provides a summary of all indicator products and relevant collection methodology information.

## Chapter 6: Special cases

### A. Housing

#### 1. Introduction

Essentially there are two types of arrangements that characterise the housing market: a house is occupied by the owner of the property, or rented out by a property owner to a tenant. Estimating the cost of housing should consider these two arrangements.

Defining actual rentals is straightforward. These are the amounts actually paid by tenants to the property owner for the provision of accommodation. Typically, a tenant and property owner enter into a rental agreement valid for a particular period of time, for example 12 months. The measurement of actual rentals is expected to track the average changes of all rental agreements.

Owners' Equivalent Rent (OER) measures the value of the services yielded by the use of an owner-occupied dwelling over a period of time by the corresponding market rental value for the same type of dwelling for the same period of time. This appraisal is based on the opportunity cost incurred by the owners by deciding to live in their own home, rather than renting it out. In other words, owners who decide to live in their homes are paying a virtual rent to themselves.

#### 2. Actual rentals for housing

The sample of indicator products includes houses, townhouses and flats. Stats SA conducts its own rental survey of letting agents. From 2009, fieldworkers visit letting agents in order to record rental prices of actual rented properties. The collection is carried out on a quarterly basis.

#### 3. Owners' equivalent rent

Owner-occupier housing costs represent the largest single component of the Consumer Price Index. Previously these costs were measured by interest rates on mortgage bonds. Interest rates are an inappropriate measure of housing costs as they reflect the cost of debt rather than the cost of housing.

There are three approaches to measuring owners' equivalent rent: acquisitions, user cost and rental equivalence. The first two require data that are not available in South Africa. The third approach requires data on rentals of equivalent dwellings. Not only are these data available, but it can be used with no significant risk of error.

Therefore, Stats SA uses the concept of owners' equivalent rent (rental equivalence) measure of housing. This concept reflects the cost associated with the benefit of the accommodation services derived by owner-occupiers from their own homes. It excludes the investment component of home

ownership. Owners' equivalent rent measures the opportunity cost to the owners of forgoing a rental income by living in rather than renting out the house they own. Rental equivalence is used because the measure is conceptually clear, required data are available, and the rental sector in South Africa represents adequately the owner-occupied component.

#### 4. Statistics South Africa's rental survey

Stats SA's quarterly rental survey tracks actual rental values for specific dwellings in each relevant geographic area. Actual rentals for a given dwelling are compared from one quarter to the next, enabling the calculation of quarterly price relatives for that dwelling.

The sample is made up of actual real estate agents, renting privately owned dwellings to the public in all CPI areas. The sample covers a wide geographic spread. Housing types are selected to represent the formal property rental market. The housing types are thus flats, townhouses, and houses.

### B. Seasonal fruit

Prior to 2013, all seasonal fruit were excluded from the CPI product list to avoid missing prices in non-seasonal months. International advice suggests that it is a more robust practice to include them. A practice of the 'seasonal basket' was introduced in the South African CPI in 2013. In this method, seasonal fruit as a collective has one weight. The contents of the basket changes as seasons change. The list was determined on the basis of data sourced from fresh produce markets.

**Table 3: Seasonal basket composition**

Indicator product	Indicator product code	Basket months
Naartjies - fresh	01161003	Jun, Jul, Aug, Sep, Oct
Pears - fresh	01164001	Jun, Jul, Aug, Sep, Oct, Nov
Peaches - fresh	01165002	Jan, Feb, Oct, Nov, Dec
Plums - fresh	01165003	Jan, Feb, Mar, Apr
Avocados - fresh	01165004	Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec
Nectarines - fresh	01165005	Jan, Feb, Dec
Grapes - fresh	01166001	Jan, Feb, Mar, Apr, May, Jun, Nov, Dec
Strawberries - fresh	01166002	May, Jun, Jul, Aug, Sep, Oct
Paw-Paw/Papayas - fresh	01167001	Apr, May, Jun, Jul, Sep, Oct, Nov
Pineapples - fresh	01167002	Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec

Mangoes - fresh	01167003	Jan, Feb, Mar, Apr, Dec
Watermelon - fresh	01167004	Jan, Feb, Oct, Nov, Dec

Non-seasonal fruit in the basket (currently bananas and apples) have their own weight.

## C. Used vehicles

### Previous methodology

The pricing methodology used up to December 2016 for used motor vehicles compared prices for two consecutive months. Because used vehicle prices are driven by depreciation, this resulted in declining price indices for used motor vehicles.

### New methodology

In order to eliminate the depreciation effect in the price indices for used motor vehicles, a revised pricing methodology was implemented in 2017. The new methodology also uses the TransUnion Auto Dealer Guide book for used motor vehicles prices as data source, and also compares prices for a selected sample of one- and two-year-old motor vehicles. The sample is updated every year in January. A selected vehicle in the new sample is then compared with a similar (model and age) vehicle in the previous sample over a 12-month period, and the year-on-year price ratio for this vehicle is established. The month-on-month price ratio is then derived from the calculated annual rate.

This new methodology has several advantages compared to the previous methodology:

- The depreciation effect is eliminated and the year-on-year price changes are a better reflection of consumer expectations.
- The year-on-year price changes do not show depreciation.
- The exaggerated price changes in January months (as provided by the data source) are avoided.

## D. Games of chance

### Introduction

Games of chance are considered recreational consumption expenditure in the South African consumer price index and the national accounts. This is in line with the international product classification system for the CPI (COICOP). Internationally, many countries include games of chance in their CPI, and those that exclude it usually do so on the basis of the difficulty in tracking comparable prices. Expenditure on gambling in South Africa amounts to more than one per cent of the current CPI weights. The expenditure value in the CPI weights and the national accounts is calculated on a net basis (total gambling revenue minus winnings).

### **Previous pricing methodology**

The previous pricing method for games of chance uses the ticket price of games run by the national lottery. Internationally, the prices of lottery tickets are commonly used as a proxy where gambling is state regulated – as it is in South Africa. Lottery ticket prices are surveyed annually by Stats SA. Since their inclusion in the CPI in 2008, there have only been two price increases in lottery tickets (2009 and 2015). Price changes were captured into the CPI without consideration of any changes in potential winnings.

### **Revised pricing methodology from 2017**

An increase in the price of a lottery ticket should be seen in the context of any change in the possible winnings that players may receive. The change in the ticket price to be included in the CPI should be adjusted to account for any change in the winnings. For example, if the ticket price increased by 20%, and the potential winnings by 10%, then the effective price increases (in the CPI) would be calculated as 9%. This method is similar to that used for CPI calculation purposes when the quantity of a product changes and an adjustment to the price change is affected. The proportion of ticket revenues due to the winners is determined by the payout ratio attached to each game. This ratio is agreed between the lottery operator and the National Lotteries Commission. Any change in price will therefore be quality adjusted by the payout ratio. Any change in the payout ratio without a change in the ticket price will also be considered a price change.

## Chapter 7: CPI compilation

### 1. Elementary indices

Compilers of the CPI have to select representative products within an elementary aggregate and then collect a sample of each of the representative products, usually from a sample of different outlets. The individual products for which prices are actually collected are described as the sampled products. Their prices are collected over a succession of time periods. An elementary price index is therefore typically calculated from two sets of matched price observations.

The price index for an aggregate is calculated as a weighted average of the price indices for the sub-aggregates, the (expenditure or sales) weights and type of average being determined by the index formula. The lowest-level aggregates are called elementary aggregates.

Since the elementary aggregates form the building blocks of a CPI, the choice of an inappropriate formula at this level can have a tremendous impact on the overall index. The definition of an elementary aggregate involves aggregation over four possible dimensions:

- A time dimension; i.e. the index number could be calculated for all item transactions for a year, a month, a week, or a day;
- A spatial dimension; i.e. the index number could be calculated for all item transactions in the country, province or state, city, neighbourhood, or individual location (South African selection);
- A product dimension; i.e. the index number could be calculated for all item transactions in a broad general category (e.g. food), in a more specific category (e.g. margarine), for a particular brand (ignoring any particular size) or for a particular narrowly-defined item (e.g. a particular universal product code); and
- A sectoral (or entity or economic agent) dimension; the i.e. index number could be calculated for a particular class of households or a particular class of outlets.

### 2. Calculating the South African CPI

The CPI measures price change by comparing the cost of a fixed basket of commodities. This basket is based on expenditures in a particular reference period. The basket contains only commodities of unchanging or equivalent quantity and quality, the index reflects pure price movements.

The calculation of the South African CPI entails calculating price relatives using prices in the current and previous survey periods. The survey periods are equal to a month. In the first stage of calculation, for each of the products (goods or services) for which prices are collected, an elementary index is calculated using the Jevons index number formula. The Jevons index is defined as the unweighted geometric mean of the price ratios (relatives).

$$I_J^{0:t} = \prod \left( \frac{p_i^t}{p_i^0} \right)^{1/n}$$

The chained monthly indices link together the month-to-month changes through successive multiplication. The Jevons formula is transitive as the chained monthly indices are identical to the corresponding direct indices which compare prices in each successive month directly with those of the reference month.

The second stage of calculating the CPI does not involve individual prices or quantities. Instead, a higher-level index is calculated as a Young index in which the elementary price indices are averaged using a set of predetermined weights. The formula can be written as follows:

$$I^{0:t} = \sum w_i^b I_i^{0:t}, \sum w_i^b = 1$$

where  $I^{0:t}$  denotes the overall CPI, or any high-level index, from period 0 to  $t$ ;  $w_i^b$  is the weight attached to each of the elementary price indices; and  $I_i^{0:t}$  is the corresponding elementary price index. The elementary indices are identified by the subscript  $i$ , whereas the higher-level index carries no subscript. The weights are derived in period  $b$ , which in practice has to precede period 0, the price reference period. There are three kinds of reference periods:

- Weight reference period. The period covered by the expenditure statistics used to calculate the weight. Usually, the weight reference period is a year.
- Price reference period. The period whose prices are used as denominators in index calculation. All future prices to be collected are then compared to these prices in calculating the index.
- Index reference period. The period for which the index is set to 100, also referred to as the base period.

## 2.1 Numerical example

The following example shows the calculations applicable to “Instant coffee”.

**Table 4: Calculating the price relative**

Product code							
01211001	<b>INSTANT COFFEE</b>						
Unique number	Respondent	Quantity	Unit	Previous price	Current price	Price relative	Geometric mean
xxxxxxx	Pick n Pay	1 tin	750g	61,99	61,99	1,00000	
yyyyyyy	Checkers	1 tin	250g	16,99	15,99	0,94114	
zzzzzzz	Woolworths	1 pouch	120g	19,99	21,99	1,10005	
wwwww	Corner café	1 tin	250g	18,79	18,79	1,00000	
							<b>1,00871</b>

**Table 5: Creating the index**

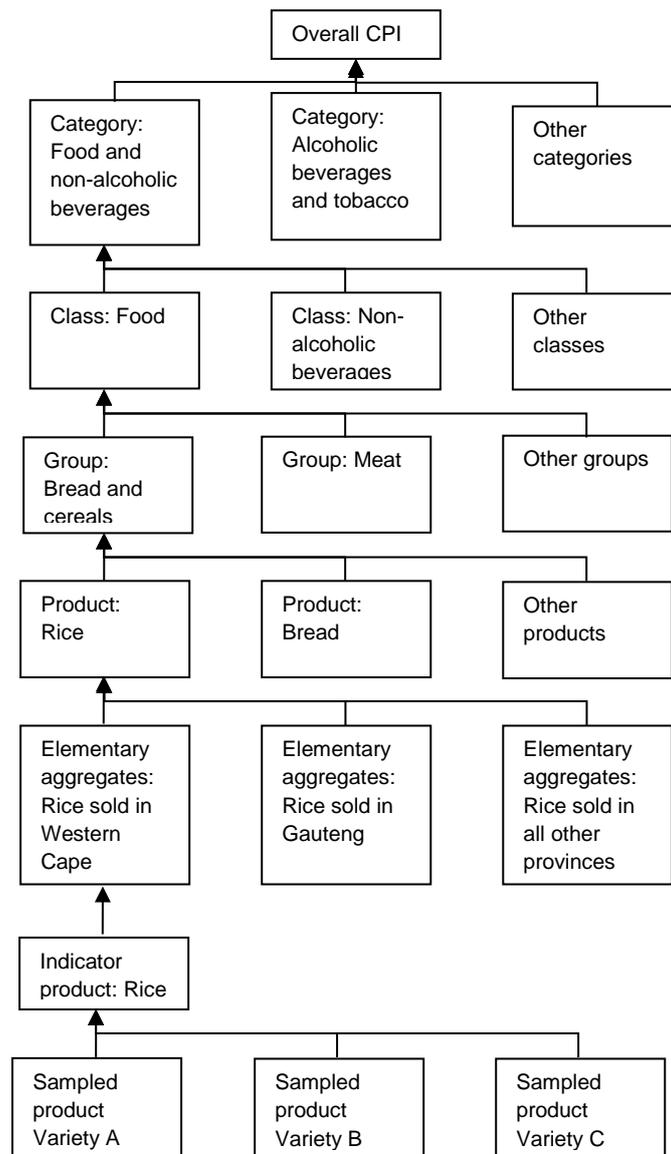

INSTANT COFFEE					
Product code		Previous index	Price relative	New index	
01211001		139,2	1,00871	140,4	
Product code	Description		New index	Weight in CPI	Weighted index
01211001	Instant coffee		140,4	0,30	42,12
01211002	Ground coffee and coffee beans		142,5	0,04	5,70
01212001	Ceylon/black tea		141,3	0,19	26,85
01212002	Rooibos tea		139,8	0,10	13,98
01213001	Drinking chocolate		138,5	0,02	2,77
0121	Hot beverages			0,65	140,64

<b>Product code</b>	<b>Description</b>	<b>New index</b>	<b>Weight in CPI</b>	
0121	Hot beverages	140,7	0,65	91,46
0122	Cold beverages	140,2	1,11	155,62
012	Non-alcoholic beverages		1,76	140,38
<b>Product code</b>	<b>Description</b>	<b>New index</b>	<b>Weight in CPI</b>	
011	Food	150,3	15,48	2326,64
012	Non-alcoholic beverages	140,4	1,76	247,104
01	Food and non-alcoholic beverages		17,24	149,28
<b>Product code</b>	<b>Description</b>	<b>New index</b>	<b>Weight in CPI</b>	
01	Food and non-alcoholic beverages	149,3	17,24	2573,93
02	Alcoholic beverages and tobacco	152,2	5,82	885,80
03	Clothing and footwear	165,4	3,83	633,48
04	Housing, water, electricity, gas and other fuels	174,9	24,62	4306,04
05	Furnishings, and household equipment	86	4,35	374,10
06	Health	122,8	1,4	171,92
07	Transport	146,1	14,28	2086,31

09	Recreation and culture	138,2	5,16	713,11
10	Education	164	2,53	414,92
11	Restaurants and hotels	145,8	3,09	450,52
12	Miscellaneous goods and services	123,4	15,05	1857,17
	CPI All Items (All urban areas)		<b>100</b>	<b>147,70</b>

Table 6: Inflation rate

	Index (previous year, same month)	Index (previous month)	Index (current month)	Monthly percentage change	Annual percentage change (inflation rate)
CPI All Items (All urban areas)	137,5	145,8	147,7	1,30	7,42

## 2.2 Graphical example of the aggregation structure of CPI

### 3. Linking new index series to old index series

From time to time, the weights for the elementary aggregates have to be revised to ensure that they reflect current expenditure patterns and consumer behaviour. When new weights are introduced, the price reference period for the new index can be the last period of the old index, the old, and the new indices being linked together at this point. The old and the new indices constitute a linked index.

The introduction of new weights is often a complex operation because it provides an opportunity to introduce new items, new samples, new data sources, new compilation practices, new elementary aggregates, new higher-level indices or new classifications. These tasks are often undertaken simultaneously at the time of reweighting to minimise overall disruption to the time series and any resulting inconvenience to users of the indices.

#### 3.1 Features of a linked index

There are several important features of a linked index:

- The linked index formula allows weights to be updated, and facilitates the introduction of new items and sub-indices and the removal of obsolete ones.
- In order to be able to link the old and the new series, an overlapping period is needed in which the index has to be calculated using both the old and the new set of weights.
- A linked index may have two or more links. Between each link period, the index may be calculated as a fixed weight index. The link period may be a month or a year.
- Linking is intended to ensure that the individual indices on all levels show the correct development through time.
- Linking leads to non-additivity. When the new series is chained onto the old, the historical higher-level indices cannot be obtained as weighted arithmetic averages of individual indices using the new weights. If, on the other hand, the index reference period is changed and the index series prior to the link period is rescaled to the new index reference period, this series cannot be aggregated to higher-level indices by use of the new weights.

#### 3.2 Method of linking and rebasing

There are many different methods of linking indices. The method followed by Stats SA is as follows: All indices are rebased so that December 2016 equals 100. All new product indices are at 100 in December 2016. Since all elementary (lowest-level) indices equal 100 in December 2016, all aggregations using the new weights also equal 100 in December 2016. The index levels for January 2017 are calculated in the normal manner (the sum of lower-level indices multiplied by their weights). This ensures that all month-on-month percentage changes from December 2016 to January 2017 are driven by price changes and the relative importance of each price change as determined by the new weights.

Similarly, the CPI for February and all subsequent months is calculated in the normal way. This method satisfies the following criteria:

- The historical, published rates of change in the CPI are retained (although historical additivity is lost);
- The base period of the CPI is December 2016 = 100;
- All monthly changes in the CPI between December 2016 and January 2017 and onwards are a true reflection of the underlying price movements; and
- All indices are calculated in the normal fashion and additivity through all aggregation levels is ensured.

	<b>January 2017</b>	<b>February 2017</b>
<b>Month-on-month</b>	<u>Jan-17 (new weights)</u> Dec-16 (rebased to 100)*	<u>Feb-17 (new weights)</u> Jan-17 (new weights)
<b>Year-on-year</b>	<u>Jan-17 (new weights)</u> Jan-16 (old weights, rebased)	<u>Feb-17 (new weights)</u> Feb-16 (old weights, rebased)

## Chapter 8: Imputations in the CPI

### 1. Introduction

Although the CPI is published monthly, certain price data are sometimes not available. This may be due to the seasonal nature of the product, the fact that prices change only periodically (such as administrative prices, tariffs and fees), or the absence of the product from outlets for various reasons (e.g. items temporarily unavailable). In all of these cases an imputation method should be used, whether at an aggregated level or a more disaggregated level. The failure to impute for missing prices may lead to a bias in the index.

### 2. Methods of imputations

#### 2.1 Matched sample

Omitting an observation from the calculation of an elementary index is equivalent to assuming that the price would have moved in the same way as the average of the prices of the items that remain included in the index. Omitting an observation changes the implicit weights attached to the other prices in the elementary aggregate.

#### 2.3 Average price change

Imputation of the missing price by the average change of the other available prices within an elementary aggregate may be applied where the prices can be expected to move in the same direction. The imputation can be made using all of the remaining prices in the elementary aggregate. As already noted, this is numerically equivalent to omitting the item for the immediate period, but it is useful to make the imputation so that if the price becomes available again in a later period, the sample size is not reduced in the current period. In some cases, depending on the homogeneity of the elementary aggregate, it may be preferable to use only a subset of items from the elementary aggregate to estimate the missing price. In some instances, this may even be a single comparable item from a similar type of outlet whose price change can be expected to be similar to that of the missing one.

#### 2.3 Carry forward

Carrying forward the last observed price should be avoided whenever possible and is acceptable only for a very limited number of periods. Special care needs to be taken in periods of high inflation or when markets are changing rapidly as a result of a high rate of innovation and product turnover. While simple to apply, carrying forward the last observed price biases the resulting index towards zero change. In addition, when the price of the missing item is recorded again, there is likely to be a compensating step-change in the index to return it to its proper value. The adverse effect on the index will be increasingly severe if the item remains unpriced for some length of time. In general, carrying forward is the least preferred procedure or solution to the problem.

### **3. Methods applied by Statistics South Africa**

Stats SA uses all three methods of imputation in the calculation of the CPI. The choice of method is determined by the level of aggregation of a particular index and the frequency of price collection for a particular product.

The matched sample approach is used when one observation in a sample for an elementary aggregate is temporarily unavailable. For example, if the CPI collects data for 10 types of tyres in Tshwane and one of those is temporarily unavailable, the average price change is calculated on the remaining nine for that area. In this way, the assumption is that the price would have moved in the same way as the average of the prices of the items that remain included in the elementary index. This type of imputation is applied to the sampled products only.

Imputation by average price change is only considered once there are no data available to calculate an average percentage change for an elementary index. The lack of data could be attributed to various causes, for example seasonal behaviour or shortages in the market. If data are missing for an elementary aggregate, the missing elementary index is imputed from the national average percentage change (average of all price changes for the same products in other publication areas).

The carry-forward approach is applied to annual, bi-annual, quarterly and other infrequent surveys in months when the item is not surveyed. It is not applied to prices in their survey month and is not applied to prices collected monthly. In the case of these periodic changes, it is legitimate to infer that the prices should remain constant until the next change. This type of imputation is applied to the sampled products only.

## Chapter 9: Quality and quantity adjustments in the CPI

### 1. Quality adjustments in the CPI

The objective of the CPI is to measure pure price change over time, so ideally identical goods and services should be priced from one period to the next. This is called pricing to constant quality. However, in practice, new products appear on the market and replace older products. These new products have different attributes (or quality). For price index purposes, it is necessary to measure these changes in quality, and to remove any change in price attributable purely to the change in quality, from the inflationary movement in the price.

South African CPI applies quality adjustment in the cases where changes are made to the characteristics or size of a product. This ensures that only price changes for identical products (matching sample approach) are incorporated into the CPI. This method is internationally accredited, but has the disadvantage of ignoring implicit price changes caused by changing characteristics.

Quality adjustments are the process of estimating what the market price of a replacement product would be if it had the characteristics of the product it replaces and with whose price its price is to be compared. The process requires estimating the market value of any differences in the price-determining characteristics of the two products and adjusting by addition, subtraction or multiplication by a coefficient – the observed price of the replacement product. The methods that are commonly used for quality adjustments are:

- **Overall mean imputation** – the use of price movements of a similar item or items to estimate an overlap price for the old item.
- **Class mean imputation** – impute price changes based on price changes of comparable items.
- **Production cost method** – adjusts prices on the foundation that the difference between the qualities of old and new products corresponds to the difference in costs to make products. Quality changes can therefore be removed from replacement products if the cost of these quality changes can be determined or is available.
- **Hedonic regression** – different variables affecting a product's price are regressed against the price of the product in order to determine the value of the product should the variables change.

The products where quality adjustments are conducted are: motor vehicles, cellphones, decoders, DVD players and TVs.

The aim of quality adjustments is mainly to estimate the market price for a substitute product if the characteristics are held constant between the old and substitute varieties. In line with international best practice, Stats SA uses Hedonic regressions to quality adjust for the products listed above. This is done by identifying the (price determining) characteristics of a product and using these in a regression analysis.

Parameter estimates are obtained from the hedonic model to adjust the price change used in index calculations in instances where the new item and old item differ in quality. The new price is then adjusted using these results. This allows the price series to be extended using the substitute product.

## **2. Quantity adjustments in the CPI**

A quantity adjustment is a form of quality adjustment where a change in the quantity of a product results in the adjustment of a price. In other words, the quantity change may take the form of a change in the physical characteristics of the product that can easily be quantified, such as change in weight, dimensions, purity, or chemical composition of a product. Quantity adjustments are applied to products with permanent quantity structure changes.

Quantity adjustment is one of the most straightforward explicit adjustments to undertake. It is applicable when the size of the replacement item differs from that of the available item. This is accomplished by scaling the price of the old or new product by the ratio of quantities.

## Definitions

<b>Acquisitions approach</b>	The acquisitions approach measures changes in the price paid by householders for net acquisitions of homes, purchased from the corporate or the public sector. In practice, this means homes built by developers or the state and sold to households for the first time. It includes major additions and alterations to existing homes.
<b>Aggregate</b>	A set of transactions relating to a specified flow of goods and services, such as the total purchases made by resident households of consumer goods and services in some period. The term “aggregate” is also used to mean the value of the designated set of transactions.
<b>Aggregation</b>	The process of combining or adding different sets of price changes to obtain larger sets of price changes.  The larger set is described as having a higher level of aggregation than the sets of which it is composed.
<b>Auditing</b>	The process of applying more extensive methods of measurement to a subsample during the scheduled conduct of a survey in order to determine the effect of non-sampling errors.
<b>Base period</b>	The base period is usually understood to mean the period with which all the other periods are compared.
<b>Basket</b>	A specified set of goods and services.
<b>Bias</b>	A systematic tendency for the calculated CPI to diverge from some ideal or preferred index, resulting from the method of data collection or processing, or the index formula used.
<b>Category</b>	In COICOP: classification of goods and service at 2-digit level.
<b>Chain index</b>	An index number in which the value at any given period is related to a base in the previous period, as distinct from one which is related to a fixed base.
<b>Chaining</b>	Joining together two indices that overlap in one period by rescaling one of them to make its value equal to that of the other in the same period, thus combining them into single time series. More complex methods may be used to link together indices that overlap by more than period (OECD).

<b>Class</b>	In COICOP: classification of goods and services at 3-digit level.
<b>COICOP</b>	Classification of individual consumption by purpose.
<b>Collection frequency</b>	Frequency of data collection, e.g. monthly, quarterly or annually.
<b>Collection method</b>	The methods of collection include the use of direct (field) collection, internet, email, post or fax.
<b>Consumer price index (CPI)</b>	Price index compiled and published by an official statistical agency that measures changes in the prices of consumption goods and services acquired or used by households. Its exact definition may vary from country to country.
<b>Consumption expenditure</b>	Expenditure on goods and services acquired and privately used by household members, including imputed values for items produced and consumed by the household itself.
<b>Cost of living index (COLI)</b>	An index that measures the change between two periods in the minimum expenditures that would be incurred by a utility-maximising consumer, whose preferences or tastes remain unchanged, in order to maintain a given level of utility (or standard of living or welfare).
<b>CPI collection areas</b>	The cities, towns or municipalities from which sample prices for indicator products are collected.
<b>CPI compilation</b>	The process of calculating the CPI.
<b>CPI core index</b>	CPI excluding items that are policy determined, seasonal or volatile.
<b>Data editing</b>	A process of cleaning raw data to remove coverage or content errors by applying a set of pre-determined rules.
<b>Deflator</b>	A price index that is used to divide the value of some aggregate in order to revalue its quantities at the prices of the price reference period.
<b>Democratic weights</b>	Each household is given equal weight in the calculation of the index, irrespectively of the size of its expenditures.
<b>Depreciation</b>	Depreciation is the loss in value of an asset due to consumption and ageing.
<b>Diary method</b>	A data collection method whereby respondents are given open-ended forms (diaries) to record all purchases (acquisitions) on a

	daily basis.
<b>Durables</b>	A consumption good that can be used repeatedly or continuously for purposes of consumption over a long period of time, typically several years.
<b>Dwelling unit</b>	Structure or part of a structure or group of structures occupied or meant to be occupied by one or more than one household. Includes structure or part of a structure that is vacant and/or under construction, but can be lived in at the time of the survey. Includes units in collective living quarters.
<b>Elementary aggregates</b>	The smallest aggregate for which expenditure data are available and used for CPI purposes. The values of the elementary aggregates are used to weight the price indices for elementary aggregates to obtain higher-level indices.
<b>Exchange rate</b>	Exchange rates are the price of one country's' currency in relation to another.
<b>Expenditure weights</b>	See weights.
<b>Field collection</b>	The direct collection of prices from outlets by fieldworkers (price collectors).
<b>Fisher price index</b>	The geometric average of the Laspeyres price index and the Paasche price index.
<b>GDP</b>	Gross Domestic Product. The total value of goods and services produced within the geographic boundaries of a country for a specified period of time.
<b>Geometric mean</b>	A method of calculating an average by taking the nth root of the product of n items.
<b>Harmonised consumer price index (HCPI)</b>	Consumer price index developed from concepts, definitions and methods that are comparable by Member State.
<b>Head office collection</b>	The collection of prices by staff based at Stats SA head office via internet, email and telephone.
<b>Headline CPI</b>	This monthly price index is compiled and published measuring changes in the prices of consumption goods and services for all urban areas.
<b>Hedonic regression</b>	A regression technique in which observed prices of different

	qualities or models of the same generic good or service are expressed as a function of the characteristics of the goods or services in question.
<b>Household</b>	Households may be individual persons living alone, or groups of persons living together who make common provision for food or other essentials for living.
<b>Household Expenditure Survey</b>	Sample survey of households in which the households are asked to provide data on, or estimates of, the amounts they spend on consumption goods and services over a given period of time.
<b>Imputation</b>	Data imputation is the substitution of estimated values for missing or inconsistent data items.
<b>Index number</b>	An index number is a figure reflecting price or quantity compared with a standard or base value.
<b>Index reference period</b>	The period for which the value of the index is set equal to 100.
<b>Indexation</b>	The periodic adjustment of the money values of regular scheduled payments based on the movement of the CPI or some other price index. The payments may be wages or salaries, social security or other pensions, other social security benefits, rents, interest payments, etc.
<b>Indicator products</b>	Representative products within an elementary aggregate for which a sample of prices is collected.
<b>Inflation</b>	The persistent change in the general level of prices.
<b>Inflation rate</b>	The percentage change in the CPI.
<b>Initiation</b>	Initiation occurs when the price of an item is recorded for the first time.
<b>Interest rate on mortgage bond</b>	An interest rate is the cost of capital borrowed for the purpose of purchasing a house, which is in turn used by the lender (e.g. banks) as surety for the loan.
<b>Jevons price index</b>	An elementary price index defined as the unweighted geometric average of the sample price relatives.
<b>Laspeyres price index</b>	A price index defined as a fixed weight, or fixed basket, index which uses the basket of goods and services of the base period. The base period serves as both the weight reference period and the

	price reference period. It is identical with a weighted arithmetic average of the current to base period price relatives using the value shares of the base period as weights.
<b>Link factor</b>	A ratio used to join a new index series to an old index series to form a continuous series.
<b>Linking</b>	Splicing together two consecutive sequences of price observations, or price indices, that overlap in one or more periods. When the two sequences overlap by a single period, the usual procedure is simply to rescale one or the other sequence so that the value in the overlap period is the same in both sequences, and the spliced sequences form one continuous series.
<b>Low index</b>	A price index that measures the proportionate change between periods 0 and t in the total value of a specified basket of goods and services. The basket does not necessarily have to consist of the actual quantities in some period.
<b>Minibus taxi</b>	A motor vehicle that usually seats about 15 passengers and is used for public transport.
<b>Month-on-month changes</b>	Changes in levels expressed with respect to the previous month.
<b>Municipality</b>	A generic term describing the unit of government in the third sphere responsible for local government in a geographically demarcated area. It includes district, local and metropolitan municipalities.
<b>Net expenditure approach</b>	Household expenditure less claims or income received.
<b>Non-durables</b>	Household items that do not last long, for example food and personal care items. Households acquire these items on a daily, weekly or monthly basis.
<b>Opportunity cost</b>	The concept of opportunity cost is commonly used in economics; it is measured by reference to the opportunities foregone at the time an asset or resource is used, as distinct from the costs incurred at some time in the past to acquire the asset, or the payments which could be realized by an alternative use of a resource (e.g. the use of labour in a voluntary capacity being valued at the wages which could have been earned in a paid job).
<b>Ottawa Group</b>	This international expert group is also known as the United Nations International Working Group on Price Indices. The group focuses on applied research in the area of consumer price indices.

<b>Owner-occupied housing</b>	Dwellings owned by the households that live in them. The dwellings are fixed assets that their owners use to produce housing services for their own consumption, these services being included within the scope of the CPI.
<b>Owners' equivalent rent</b>	The cost of consuming a housing service. It is the opportunity cost incurred by owners who live in their own home rather than renting it out.
<b>Paasche price index</b>	A price index defined as a fixed weight, or fixed basket, index which uses the basket of goods and services of the current period. The current period serves as the weight reference period and the base period as the price reference period. It is identical with a weighted harmonic average of the current to base period price relatives using the value shares of the current period as weights.
<b>Payments approach</b>	Payments for a particular good should be allocated to the period in which they were made, irrespective of whether the product was delivered (consumed) or not. This approach is not generally used in CPIs.
<b>Plutocratic weights</b>	Households are given different weights in the calculation of the index according to their relative importance, which is mostly based on expenditure.
<b>Price reference period</b>	The period that provides the prices with which the prices in other periods are compared. The prices of the price reference period appear in the denominators of the price relatives, or price ratios, used to calculate the index. The price reference period is typically designated as period 0 or t-1.
<b>Price relative</b>	The ratio of the price of an individual product in one period to the price of that same product in some other period.
<b>Price updating</b>	A procedure whereby the quantities in the weight reference period are revalued at the prices of a later period that serves as the price reference period, typically the period preceding the current period. In other words, revaluing the weights in order to ensure that they are effectively based on the underlying quantities or volumes of the price reference period.
<b>Provincial basket</b>	A specified set of goods and services in a specific province. In a CPI context, the set may comprise the actual quantities of consumption goods or services acquired or used by households in

	some period.
<b>Purchasing power parity</b>	PPPs are the rates of currency conversion that equalise the purchasing power of different currencies by eliminating the differences in price levels between countries. In their simplest form, PPPs are simply price relatives that show the ratio of the prices in national currencies of the same good or service in different countries. PPPs are also calculated for product groups and for each of the various levels of aggregation up to and including GDP.
<b>Purposive sampling</b>	A purposive sample is one which is selected subjectively. The sampler attempts to obtain a sample that appears to him/her to be representative of the population, and will usually try to ensure that a range from one extreme to the other is included.
<b>Quality adjustments</b>	<p>Quality adjustments are the process – or the result of the process – of estimating what the market price of a replacement product would be if it had the characteristics of the product it replaces and with whose price its price is to be compared.</p> <p>The process requires estimating the market value of any differences in the price-determining characteristics of the two products and adjusting – by addition, subtraction or multiplication by a coefficient – the observed price of the replacement product.</p>
<b>Rebasing</b>	<p>Rebasing may mean:</p> <ul style="list-style-type: none"> <li>– changing the price reference period used for a series of indices;</li> <li>or</li> <li>– changing the index reference period for a series of indices.</li> </ul> <p>The price reference period and index reference period may be changed separately or at the same time.</p>
<b>Recall method</b>	A data collection method whereby respondents are asked to recall information for a reference period several months prior to the current survey month.
<b>Reference period</b>	The period of time relevant for a particular survey.
<b>Reference population</b>	The set of households included within the scope of the index.
<b>Regulated prices</b>	Regulated prices are those administered prices that are controlled by government policy. To this end, price regulation does not necessarily imply the presence of an economic regulator, but the restriction on the extent to which prices may vary, depending on government's policy objective. Products and services included are

	water, electricity, paraffin, petrol, diesel, and telephone fees.
<b>Rental equivalence</b>	The estimation of the imputed rents payable by owner-occupiers based on the rents payable in the market for accommodation of the same type.
<b>Respondent</b>	The person or organisation that answers survey questions or completes the questionnaire.
<b>Reweighting</b>	Replacing the weights used in an index by a new set of weights.
<b>Sampling</b>	Selecting elements from a population in such a way that they are representative of the population.
<b>Sampling frame</b>	A comprehensive list of distinct and distinguishable units within a population from which a sample is drawn.
<b>Scope</b>	The set of products for which the index is intended to measure the price changes. The scope of a CPI will generally be defined in terms of a designated set of consumption goods and services purchased by a designated set of households.
<b>Semi-durables</b>	Semi-durable goods differ from durable goods in that their expected lifetime of use, though more than one year, is often significantly shorter and their purchasers' value is substantially less.
<b>Services</b>	A service is the diametrically opposed non-material counterpart of a physical good. A service provision comprises a sequence of activities that does not result in ownership of the outcome.
<b>Substitution</b>	<ul style="list-style-type: none"> <li>– of outlets: Substitution of similar outlets occurs to replace outlets that have closed down.</li> <li>– of products: Substitution of similar products occurs to replace items that have become permanently unavailable.</li> </ul>
<b>Substitution bias</b>	This is generally understood to be the bias that results when a basket index is used to estimate a cost of living index, because a basket index cannot take account of the effects on the cost of living of the substitutions made by consumers in response to changes in relative prices. In general, the earlier the period to which the basket relates, the greater the upward bias in the index.
<b>Survey</b>	A process which collects, examines, and reports on data concerning variables of interest for a reference period.

<b>System of National Accounts (SNA)</b>	A coherent, consistent, and integrated set of macroeconomic accounts, balance sheets, and tables based on a set of internationally agreed concepts, definitions, classifications, and accounting rules. Household income and consumption expenditure accounts form part of the SNA. The expenditure data are one of the sources that are used to estimate expenditure weights for CPI purposes.
<b>Urban</b>	A continuously built-up area with characteristics such as type of economic activity and land use, proclaimed as such under the pre-1998 municipal demarcation or classified as such by the Geography department of Stats SA based on their observation. Cities, towns, townships and suburbs are typical urban areas.
<b>User cost</b>	The cost incurred over a period of time by the owner of a fixed asset or consumer durable as a consequence of using it to provide a flow of capital or consumption services.
<b>Utility</b>	The satisfaction derived from consumption of a good or service.
<b>Value</b>	Price X quantity.
<b>Volume seller</b>	The volume seller is based on the quantity sold. In general, the volume seller is assumed to be the brand and unit with the most shelf space allocated to it.
<b>Weights</b>	A set of numbers summing to unity that are used to calculate averages. Weights represent the relevant importance of the indicator product in a subgroup. The weight of a product is calculated by dividing the total expenditure by households on that product by the total expenditure on all goods and services by households.
<b>Weights reference period</b>	The period, usually one or more years, of which the expenditures serve as weights for the index.
<b>Year-on-year</b>	Changes in levels expressed over the corresponding period (month or quarter in relation to the frequency of the data) of the previous year.
<b>Young index</b>	An index calculated as a weighted arithmetic average of the individual price relatives, holding constant the expenditure shares of the weight reference period.
